

# Species New to Science

new & recent described Flora & Fauna species from all over the World esp. Asia, Oriental, Indomalayan & Malesiana region

Tuesday, June 15, 2021

## [Paleontology • 2021] *Oculudentavis naga* • Unusual Morphology in the mid-Cretaceous Lizard *Oculudentavis* (Reptilia: Squamata)

***Oculudentavis naga***

Bolet, Stanley, Daza, Arias, Černánský, Vidal-García, Bauer, Bevitt, Peretti & Evans, 2021

DOI: [10.1016/j.cub.2021.05.040](https://doi.org/10.1016/j.cub.2021.05.040)

Scientific illustration by Stephanie Abramowicz.

### Highlights:

- A new species of the reptile in amber, *Oculudentavis*, is described
  - *Oculudentavis* is a bizarre lizard, not a bird
- The bird-like appearance of *Oculudentavis* is due to convergence in skull proportions

### Summary

*Oculudentavis khaungrae* was described based on a tiny skull trapped in amber. The slender tapering rostrum with retracted narial openings, large eyes, and short vaulted braincase led to its identification as the smallest avian dinosaur on record, comparable to the smallest living hummingbirds. Despite its bird-like appearance, *Oculudentavis* showed several features inconsistent with its original phylogenetic placement. Here, we describe a more complete specimen that demonstrates *Oculudentavis* is actually a bizarre lizard of uncertain position. The new specimen is described as a new species within the genus *Oculudentavis*. The new interpretation and phylogenetic placement highlight a rare case of convergent evolution in skull proportions but apparently not in morphological characters. Our results re-affirm the importance of Myanmar amber in yielding unusual taxa from a forest ecosystem rarely represented in the fossil record.

**Keywords:** burmite, dinosaur, lizard, HRCT, synchrotron, Myanmar, comparative anatomy, phylogenetic analyses, osteology, Cretaceous

### Oculudentavis naga new species

**Holotype:** Peretti Museum Foundation, GRS-Ref-28627, a skull and anterior postcranial skeleton (Figures 1, 2A–2J, 3A, 3C, and S1). Three-dimensional model of new specimen available at <https://tinyurl.com/Oculudentavis-L-10420>.

**Type locality:** The holotype specimen of *Oculudentavis naga* (GRS-Ref-28627) and the holotype of *O. khaungraae* (HPG-15-3) were recovered from the same mine (Aung Bar mine, 26° 09' N, 96° 34' E).

**Diagnosis:** The holotype of *O. naga* (skull length = 14.2 mm) is somewhat smaller than that of *O. khaungraae* (skull length = 17.3 mm). *Oculudentavis naga* differs from *O. khaungraae* in having a jugal process of the maxilla that reaches caudally to less than 25% of orbit length; in having a long squamosal process of the postorbital; in having a relatively smaller braincase, with short, distally expanded basipterygoid processes (versus longer, unexpanded processes); and in having anterior palatal rami of pterygoids parallel, diverging posteriorly just behind the fossa columellae, interpterygoid vacuity nearly rectangular (versus divergent pterygoids, heart-shaped vacuity), rostral part of premaxilla shorter and proportionally wider than that of *O. khaungraae*, and less conspicuous platform on the dorsolabial surface of the posterior third of the dentary.

**Etymology:** Combination of *Oculudentavis* (*oculus* = eye, *dentes* = teeth, and *avis* = bird) and *Naga*, the name of one of the many ethnic tribes living in the Burmese amber mines area. The Naga are mentioned in historical chronicles for their prominent role in amber trading. Divided into many sub-groups scattered across the hills and jungle of India (in Nagaland and other states) and in the Tiger valley region of Burma (where amber deposits are found), the Naga tribes are also reputed for their rich and fascinating culture.
